Xtools Pro 11 Full Crack 219

Acunetix Web Vulnerability Scanner (Consultant Edition)

PHP-CGI remote code execution

Vulnerability description

PHP is a widely-used general-purpose scripting language that is especially suited for Web development and can be embedded into HTML. When PHP is used in a CGI-based setup (such as Apache's mod_cgid), in some configurations it's possible to execute arbitrary code with the privileges of the web server. On Debian and Ubuntu the vulnerability is present in the default install of the php5-cgi package. When the php5-cgi package is installed on Debian and Ubuntu or php-cgi is installed manually the php-cgi binary is accessible under /cgi-bin/php5 and /cgi-bin/php. The vulnerability makes it possible to execute the binary because this binary has a security check enabled when installed with Apache http server and this security check is circumvented by the exploit.

Affected versions:
- PHP prior to 5.3.12
- PHP prior to 5.4.2

Unaffected versions:
- PHP 4 - getopt parser unexploitable
- PHP 5.3.12 and up
- PHP 5.4.2 and up

This vulnerability affects

Discovered by: Scripting (PHP_CGI_RCE_Force_Redirect.script).
